Producing recombinant protein, particularly for maximizing or enhancing e.g. therapeutic protein production, by co-expressing protein with recombinant cell cycle inhibitor protein (p21) in producer cell line.

WPI; 2003-148669/14.

Disclosure; Page 32-33; 33pp; English.

promoter. The present sequence is used to produce vectors for use in the method of the invention. The specification describes a method for producing a protein, preferably a recombinant protein, in a mammalian anchorage-independent producer cell line. The method comprises coexpressing with the protein in the producer cell line a recombinant cell cycle inhibitor protein (preferably p21). The method is useful for producing a recombinant protein in a producer cell line. This is The present sequence represents the Rous sarcoma virus (RSV)-LTR

Also described is a primate cell (I) containing and capable of expressing a transgene comprising an RSV promoter operably linked to a recombinant nucleic acid encoding one or more fusion proteins, where the fusion proteins bind to a ligand and in the presence of the ligand modulate(s) the expression level of a target gene. The method can be used for high level expression of genes in primates or for engineering primate cells. It is useful for increasing the efficacy of many gene therapy strategies, and for increasing the efficacy of intracellular immunisation agents, molecules

```

```
This is the nucleotide sequence of a SatI fragment of plasmid CMV-delRT, in which the immediate-early promoter of human cytomegalovirus replaces the 5' long termal repeat region of feline immunodeficiency virus (FIV) clone F14-delRT (see AAV88053). FIV sequences downstream of the SatI site are identical to those in F14-delRT. Use of the CMV promoter was designed reversion to a replicating provirus, in tissues after incculation of DNA. Vaccine formulations for FIV-related diseases include a defective feline

```

like ribozymes, antisense RNA, and dominant negative proteins, that act either stoichiometrically, or by competition. The method increases the efficacy of many gene therapy strategies by substantially elevating the expression of an exogenous therapeutic gene, and allowing expression to reach therapeutically effective levels. The present sequence represents specifically claimed RSV enhancer/promoter nucleotide sequence from the

Engrafting foreign replacement cells within a fetal non-human mammal, useful in producing chimeric mammals, comprises selectively destroying native cells in a tissue of a fetal non-human mammal host.

Disclosure; SEQ ID NO 3; 48pp; English.

The present invention describes a method for engrafting foreign replacement cells within a foetal non-human mammal, which comprises selectively destrucying native cells in a tissue of a foetal non-human mammal host, where the number of maternal cells of the same tissue is not substantially reduced, and implanting foreign replacement cells in the tissue of the fetal non-human mammal host, where the foreign replacement cells replace destroyed cells of the tissue. The method is useful for facilitating growth and differentiation of foreign cells within a mammalian host, and for producing chimeric mammals that can be used to develop new drugs and vaccine, factors, drugs and tissues for transplantation, also useful to study human diseases. The present sequence represents a nucleotide sequence given in the Sequence Listing of the present invention but not mentioned further within the specification

```
The present invention describes a vertebrate protein homologue of an UNC-53 protein of Caenorhabditis elegans or a functional equivalent, derivative or bioprecursor of UNC-53. Also described. (1) a cDNA sequence concoling a vertebrate homologue of the C. elegans UNC-53 protein; (2) a nucleic acid which hybridises to the cDNA of (1); (3) vector comprising the cDNA as in (1); (4) a host cell containing the vector as in (3); (5) a transgenic cell; tissue or animal comprising the vector as in (3); (6) a compound identified as an enhancer or inhibitor of the regulation of cell shape, motility, or the direction of cell migration for use as a therbod for determination of whether a protein is an inhibitor or enhancer of regulation of cell behaviour, growth, shape or motility or the direction of migration by contacting a host cell computed of UNC-53 and determining a change of phenotype; (8) a method for identification of vertebrate homologues of C. elegans unc-53 gene by hybridising a probe of 15-50 by of the unc-53 sequence to a DNA library; and (9) a method for identification of a protein which is

active in the signal transduction pathway of a cell of which a vertebrate homologue of UNC-53 is a component comprising: (i) contacting an extract of a cell with an antibody to the UNC-53 homologue; (ii) identifying an antibody/homologue complex; and (iii) analysing such a complex to identify any non-antibody protein bound to the complex. UNC-53 is a signal transducing or signal integrator protein involved in controlling directionality of cell migration and cell shape in C. elegans. Vertebrate homologues of UNC-53 can be used to promote neuronal regeneration, revascularisation or wound healing, to treat chronic neurodegenerative

The method is useful for facilitating growth and differentiation of foreign cells within a mammalian host, and for producing chimeric mammals that can be used to develop new drugs and vaccine, factors, drugs and tissues for transplantation, also useful to study human diseases. The present sequence represents a nucleotide sequence given in the Sequence Listing of the present invention but not mentioned further within the
                                                                                                                                                                                                                                                       crecrecerecrisererefregaderescrearagreceseseaaaarrraascraca 140
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            replacement cell; implanting foreign replacement cell;
                                                                                                                                                                                                                    9
transplantation, also useful to study human diseases. The present sequence represents a nucleotide sequence given in the Sequence Listing of the present invention but not mentioned further within the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Engrafting foreign replacement cells within a fetal non-human mammal, useful in producing chimeric mammals, comprises selectively destroying native cells in a tissue of a fetal non-human mammal host.

The present invention describes a method for engrafting foreign replacement cells within a foetal non-human mammal, which comprises selectively destroying native cells in a tissue of a foetal non-human mammal host, where the number of maternal cells of the same tissue is not substantially reduced, and implanting foreign replacement cells in the tissue of the fetal non-human mammal host, where the foreign replacement cells replace destroyed cells of the tissue. The method is useful for facilitating growth and differentiation of foreign cells within a mammalian host, and for producing chimneric mammals that can be used to develop new drugs and vaccine, factors, drugs and tissues for

Engrafting foreign replacement cells within a fetal non-human mammal, useful in producing chimeric mammals, comprises selectively destroying native cells in a tissue of a fetal non-human mammal host.

The present sequence is used to produce vectors for use in the method of the invention. The specification describes a method for producing a protein, preferably a recombinant protein, in a mammalian anchorage-independent producer cell line. The method comprises co-expressing with the protein in the producer cell line a recombinant cell cycle inhibitor protein (preferably p21). The method is useful for producing a recombinant protein in a producer cell line. This is useful for producing a recombinant protein in a producer cell line. This is useful for producing a recombinant protein in a producer cell line. The set useful for producing a recombinant protein in a producer cell line. The set use the producing or enhancing the production of e.g. therapeutic proteins at an industrial scale

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes a method for engrafting foreign replacement cells within a foetal non-human mammal, which comprises selectively destroying native cells in a tissue of a foetal non-human mammal host, where the number of maternal cells of the same tissue is not substantially reduced, and implanting foreign replacement cells in the tissue of the fetal non-human mammal host, where the foreign replacement cells replace destroyed cells of the tissue. The method is useful for facilitating growth and differentiation of foreign cells within a mammalian host, and for producing chimeric mammals that can be used to develop new drugs and vaccine, factors, drugs and tissues for transplantation, also useful to study human diseases. The present transplantation but not mentioned further within the specification.
                                                                                                                                                                                                                                                                       46 CTGCTCCCTGCTTGTGTTGGAGGTCGCTGAGTAGTGCGCGAGCAAAATTTAAGCTACA 105

The present invention relates to a gene directed enzyme prodrug therapy (GDBPT) using post translational glycosylphosphatidylinositol (GPI) addition to a prodrug activating enzyme which enables anchorage of the enzyme at the cell surface. Carboxpeptidase G2 (CPG2) is a preferred prodrug activating enzyme. The invention also relates to an expression vector for expression of a GPI enzyme hybrid capable of anchorage to the surface of a mammalian cell. The expression vector comprise polynucleotide sequences encoding a signal peptide, an enzyme capable of activating a prodrug, and a post-translational GPI addition motif. The expression vector is useful in the manufacture of a medicament for cancer therapy in a mammalian host. The present DNA sequence is a plasmid exon of rat Thy I gene at its 3' end. The present invention relates to a gene directed enzyme prodrug therapy (GDEPT) using post translational glycosylphosphatidylinositol (GPI) addition to a prodrug activating enzyme which enables enchorage of the enzyme at the cell surface. Carboxypeptidase G2 (CPG2) is a preferred prodrug activating enzyme. The invention also relates to an expression vector for expression of a GPI enzyme hybrid capable of anchorage to the surface of a mammalian cell. The expression vector comprise polymucleotide sequences encoding a signal peptide, an enzyme capable of activating a prodrug, and a post-translational GPI addition motif. The expression vector is useful in the manufacture of a medicament for cancer therapy in a mammalian host. The present DNA sequence is a plasmid pNG3/RC/CPG2(Q3) comprising CPG2 variant CPG2(Q3) and the last exon of rat Thy-1 at the 3' end. (Updated on 11-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Plasmid pNG3/RC/CPG2(Q3)-Thy1 comprising CPG2 variant with rat thy1 gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1 CTGCTCCCTGCTTGTGTGTTGGAGGTCGCTGAGTAGTGCGCGAGCAAAATTTAAGCTACA 60

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             A DNA sequence (AAT62937) comprises a 3F4 human G2/G4 (see also AAT62936) chimeric antibody expression plasmid insert sequence. The chimeric antibody (AAW14940) is specific for porcine vascular cell adhesion molecule (VCAM) and is useful for diagnosing human rejection of porcine xenotransplants and for improving xenotransplantation of porcine cells, tissues and organs into human recipients. ```
This is the nucleotide sequence of pCTM, a plasmid which contains a CMV promoter, a tripartite adenovirus leader flanked by T7 and SP6 promoters, and a multiple cloning site with a bovine growth hormone polyA site and downstream SV40 polyA site. It has been used as a vector for the expression of fusion proteins of the invention that comprise retinoblastoma protein (BP, see AAW62465) and E2F transcription factor (see AAW62464). Such fusion proteins, particularly expressed from gene therapy vectors, are used to treat hyperproliferative conditions, specifically cancer (particularly of the bladder) or restenosis. They are more effective in repressing transcription of the E2F promoter than RB alone and cause cell-cycle arrest in a variety of cells. (Updated on 27-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CTGCTCCTGCTTGTGTGTTGGAGGTCGCTGAGTAGTGCGCGAGCAAATTTAAGCTACA 140

                                                                                                                                                                                                                                                                                           °
                                                 A DNA sequence (AAT62931) comprises a 2A2 human G2/G4 (see also AAT62931) chimeric antibody expression plasmid insert sequence. The chimeric antibody (AAW14934) is specific for porcine vascular cell adhesion molecule (VCAM) and is useful for diagnosing human rejection of porcine resortansplants and for improving xenotransplantation of porcine tissues and organs into human recipients. Selectable retroviral packaging cell lines and expression constructs - comprise selectable gene downstream of gene of interest, are selectable due to the in-efficiency associated with translation re-initiation.

Claim 23; Fig 13; 79pp; English

sequence is a packaging-deficient construct having a viral env gene (in this case from moloney murine leukaemia virus under hCMV promoter control) and a selectable marker (SM). It is an example of a recombinant expression vector (RMV) of the invention, used to create a packaging cell line. The REVS of the invention comprise a gene of interest (GOI) and a SM gene. The SM gene is arranged downstream of the GOI and a GOI associated stop codon is spaced from a start codon of the SM gene to ensure that the SM protein is expressed as a result of translation. The cell lines are transformed with two REVS, both are replication deficient, one contains the viral gap-pol gene, the other the viral env gene. By using helper constructs, such as the REV's, which are directly selectable and which provide for high expression of the viral. gene, high titre retroviral vectors may be obtained. The packaging cell lines are useful for gene therapy. Prior packaging cell lines using full length retroviral genomes as helper genomes were isolated by cotransfecting them with plasmids encoding selectable markers. However, the helper functions can be lost during the passages of the cells in culture and the current packaging systems provide limited titres of infectious retroviral vectors. Co-transfection with a plasmid encoding a SM does not directly select the best gag-pol-env-expressing cells. The new retroviral packaging cell lines overcome these problems This sequence represents the recombinant expression plasmid CMV10A. This

(http://sequence-www.stanford.edu/group/techdev/shear.htm)
The randomly sheared gDNA was chromatographed on Sephacry1 S-400 to remove any small fragments and DNA eluting in the void volume was blunt-ended with T4 DNA Polymerase, treated with alkaline phosphatase to prevent the ligation of multiple fragments, ligated to Srf I-digested pCR-Script Amp (SK+) vector and transformed into E. coli strain Xil0 Gold. Recombinant clones from the first plating of the library were selected for sequence analysis using T3 and T7 primers."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        3.4g of total RNA, treated with T4 DNA polymerase, and purified by ethanol-precipitation. The CDNAs were ligated to Lone-linker LL-Sal4, purified by phenol/chloroform extraction, and separated from free linkers by Centricon-100 column. Then, the CDNAs were amplified by long-range high fidelity PCR using Ex Tag polymerase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              /lab_host="DH10B (Tl phage-resistant)"

(Takara) with a primer Sal4-S for 25 cycles. The products were purified by phenol/chloroform extraction and Centricon-100 column. The cDNAs were digested with SalI and NotI enzymes and cloned into SalI/NotI site of pCMV-SPORT6 plasmid vector. The average insert size is about 3.6kb."

/note="Vector: pUC18; Site_1: Smal; Constructed at The Institute for Genomic Research (TIGR), Rockville, MD.
Genomic DNA isolated from a cloned population of Trypanosoma brucei (TREU927/4 GUTat 10:1) was mechanically sheared to give a tight size distribution (approx 2 kb). The v + i method used for the library construction is described in detail in Smith, H.O. and Venter, J.C. (Making small insert libraries for whole genome shotgun sequencing projects. In Genome Sequencing: A Practical Approach, eds. M. Vaudin and B. Barell, Oxford University Press, 1999)."

woodchuck hepatitis virus; postranscriptional regulatory element; ds; New trans-lenti viral vector systems with cis-acting sequences, polypurine tract-central terminators, etc., useful for gene transfer, e.g. delivering genes encoding therapeutic or viral inhibitory polypeptides to cells. integrase; gag; gag-pol precursor; polypurine tract-central terminator sequence; PPT-CTS; gene transfer; gene expression; transduction; replication competent retrovirus; RCR. trans-lenti viral vector system; Vpr; Vpx; reverse transcriptase; Woodchuck hepatitis virus postranscriptional regulatory element. BP 24-JUL-2002; 2002US-00202457. 98US-00089900. 14-DEC-1999; 99US-00460548. 13-NOV-2000; 2000US-00709501. Woodchuck hepatitis B virus. ADA38373 standard; DNA; 592 20-NOV-2003 (first entry) WPI; 2003-625514/59. (KAPP/) KAPPES J C. (WUXX/) WU X. Wu X; US2003072938-A1. 03-JUN-1998; 17-APR-2003 Kappes JC, ADA38373; ADA38373 

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The method is useful in producing transgenic animals using retroviral constructs engineered to carry a transgene of interest. The transgenic animals may find use in commercial applications like biotechnology and agriculture. The present sequence is Woodchuck hepatitis virus regulator element (WRE) DNA used to illustrate the method of the invention. (Updated on 27-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 334 recerrecececrecres acades de contra de la recerre de la recerre de la recerre de la recerre de la recerre de la recerre de la recerre de la recerre de la recerre de la recerre de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de la recerca de l
